

Vendor Integration Runbook

Document ID: OPS-VENDOR-INTEGRATION-2026-06

Classification: Internal Use Only

Owner: Enterprise Platform Operations

Purpose

This runbook describes the internal process for onboarding third-party vendors into the enterprise project collaboration platform. It is intended for solution architects, integration engineers, security reviewers, and service owners.

System Scope

The integration platform receives vendor profile data, contract milestones, implementation tickets, and delivery status events. The first release supports REST webhooks, nightly CSV imports, and manual exception review by the operations team.

Required Vendor Fields

Each vendor record must include `vendor_id`, `legal_name`, `contact_email`, `service_category`, `contract_owner`, `risk_level`, `data_region`, and `onboarding_status`. The `vendor_id` field is the stable business key and must not be reused after offboarding.

Security Controls

All inbound API requests must use signed tokens with a maximum lifetime of 30 days. Vendors that process customer data must complete a security review before production access is enabled. Test data must be masked before it is shared outside the company network.

Operational SLA

P1 integration incidents require acknowledgement within 15 minutes and mitigation within 2 hours. P2 incidents require acknowledgement within 1 hour. Daily import failures must be triaged before 10:00 local time on the next business day.

RAG Import Notes

Recommended knowledge base tags are vendor, integration, security, operations, SLA, and onboarding. This PDF is intentionally formatted as an internal project document for retrieval and citation testing.
